INSIDE YOUR WALLS

Two kinds of cable

Coax

TV cable

- Made for TV. It can carry internet too.
- Tops out around **50 Mbps**, so it can't carry our faster plans.
- In most homes from the day they were built.
- Old cable, splitters and connectors weaken both TV and internet.

Ethernet

Cat 5e, Cat 6 or better

- Made for internet.
- Carries every plan we offer, up to **1 Gbps**.
- Many newer homes have it. Many older homes don't.

Phone wire (Cat 3), common in homes built before 1980, doesn't carry internet.

Understanding the wiring in your home

GREENFIELD COMMUNICATIONS

BY PLAN

What each speed needs

Every plan needs a router: your own, or lease ours.

Fiber100	100 Mbps down, 50 up. Needs Ethernet (Cat 5e or better) to reach full speed. Coax tops out around 50 Mbps.
Fiber500	500 Mbps down, 250 up. Needs Ethernet (Cat 5e or better). Coax can't carry it.
Fiber1G	1 Gbps down, 500 up. Needs Ethernet (Cat 5e, Cat 6 or better) and a router that supports gigabit speeds.

Basic Cable (Core Basic)

- Reaches every TV connected by coax, with no box.
- Your TV needs a digital cable (QAM) tuner. Most newer TVs have one; check your TV's manual.
- No tuner? You'll need a TV package that includes a receiver.

> Not sure what's in your walls? A technician can check during a free walkthrough.

YOUR HOME

The wiring inside your home

The Greenfield equipment at your home turns our fiber into internet, TV and phone, and sends them through your home's own wiring.

That wiring belongs to your home. Its age and quality can weaken the signal, and we can help you check it.

If it needs an upgrade

- A technician does a **free walkthrough** and gives you a quote. The work is then scheduled as a separate visit.
- Or use any licensed low-voltage contractor.

Then protect it

The **Wire Maintenance plan** covers repairs to the wiring inside your home, with no labor or material charges for covered repairs.

> To book a walkthrough, call technical support at (888) 230-0020, option 1.
